As an artist myself, I do not agree with the use of other people's art to train ai models. I believe that it is a massive infringement of copyright and these models should stop being used. This is one of the biggest cases of intellectual art theft we have seen to date and there needs to be laws written to protect the integrity of art as an industry.

This point goes for writing as well. We have already seen countless articles written by chap gpt and other writing algorithms that are complete nonsense and used merely to generate clicks. These do nothing for us as a society and there needs to be a crackdown on this as well, it is also threatening the integrity of writing.

this is an extremely complex issue because on the one hand the baseline requirement (mass internet scraping) of AI art should almost certainly should be copyright infringement but on the other hand the kind of regulations that would help to curb this could also very easily be used to crack down on (if not actually that at least what should be) legitimate use of popular media for fan art. its going to have to be a very careful balancing act to get any regulation in the goldilocks zone of protecting small independent artists

I am an artist and designer based in VA. In the age of technology, creatives like me have no real choice but to share our work online, whether to market ourselves to attract clients, as part of a day job designing social media graphics for others, or any number of other reasons. In its current iteration, AI scraping is indiscriminate—it takes visual works from the internet without checking for copyright or usage permissions. It is unethical and unacceptable for the people behind machine learning software to let their projects gather and use massive databases made almost entirely of work painstakingly created by people who did not consent to its use.

In terms of protecting the livelihood of artists, AI models that generate images from large groups of works made by the hard work, practice and personal experiences of human beings are both theft and regression, making future works less inspired and without intent and robbing people who wish to bring forth art to this from their possibility to do so. In terms of general logic, since the generated works are amalgamations of copyrighted material whose source is hidden both by design and necessity they have no true creator and hence would both be loopholes to make copyrighted material available as public domain and would and impossible to assign to a single individual

As an Artisit A.I. is taking jobs away and killing my livelihood. They take copyrighted images without consent and attempt to profit off others work. An artist also doesn't receive any credit when their work is stolen. A.I simply mashes current images together. This needs to be heavily regulated, the databases deleted and a 100% opt in for said collected images. A.I is theft plain and simple. Artists and other creative fields are suffering because of A.I. They take our work and we receive nothing in return. Any other industry this would be a massive case of lawsuits.

I am writing to you as an artist and a gallerist on the subject of generative AI. As an artist and a supporter of artists and the arts, I think it is essential for the government to step in and take measures to protect the copyrights of creative people everywhere. Creativity IS humanity and the process by which AI can scrub the internet to then steal an individual's creative output for the purpose of re-creation without credit or financial payment or licensing goes against all copyright laws.

As a digital artist who takes great care to respect other artist's works, it concerns me greatly how our work and privacy can be so easily disregarded when pursuing the almighty dollar. Over the past year, I've watched AI creators and their customers justify their theft through false arguments and general ignorance on how artists learn, develop their styles and become inspired. People are not algorithms. A person can view a painting, or read a passage of text and become inspired by a memory unrelated, or even by what they noticed wasn't there. AI generated images, text and video cannot be regarded the same. Generative AI is theft as it directly copies artist's works.

As an author and an illustrator, I deeply understand that AI needs to be regulated and controlled. It's theft, plagiarism plain and simple. Any work with AI should absolutely not be able to be copyrighted- it's not theirs to begin with. The idea the work that went into creating it is not theirs to claim. It's stolen. They shouldn't be able to legally claim it. And there should be more protections for artist and writers / more legal implications for people plagiarizing creative work through the use of AI. AI does have its use- but it should not be allowed in the creative industry. There is no ethical way ai generated images and books can be created. Because it is plagiarism

Comment ID: COLC-2023-0006-8436

Generative AI is plagiarism. That is all. It scours the internet for things written, painted, photographed, drawn, created by humans, runs it through a blender, and spits it back out based on an algorithm on which things are most likely to be near the next thing. Bit by bit, pixel by pixel, letter by letter, word by word. It's all stolen from human artists. All copyright protections will be lost unless the US Copyright office does something to stop this theft. The rights to people's creative work should remain with the original artists, the rights to people's likenesses should be their own, tech companies should not be allowed to train generative AI on other peoples creativity and performances.

I strongly oppose this. I am a writer who sees that AI does nothing but imitate the work of myself and others and passes for acceptable. Companies within the creative arts and marketing will see this as a cost-cutting measure, but all it does is rip off artists who should be paid fairly for our work. Instead, it will kill the arts, while companies looking to save money will use it and accept the poor quality that imitates the real work done by humans for years. AI is plagiarism. Simple as that. AI should be seen as copyright infringement. There is no place for it in the artistic or marketing world. It is a danger to jobs.
